ABSTRACT OF THE DISCLOSURE

When installing the Microsoft Windows™ ~~windows~~ installer service, the install

system suppresses a reboot of the computer device. The install system with reboot

suppression includes a load mechanism that loads the install system to a temporary

5   directory. A directory mechanism then sets the path for the install system to the

temporary directory, and an executing mechanism executes the install system from the

temporary directory. The method suppresses a reboot of the computer device when

installing the Microsoft Windows™ ~~windows~~ installer service and includes the steps of

loading the install system to a temporary directory and setting a path for the install

10   system as the temporary directory. Then the install system is executed from the

temporary directory.
